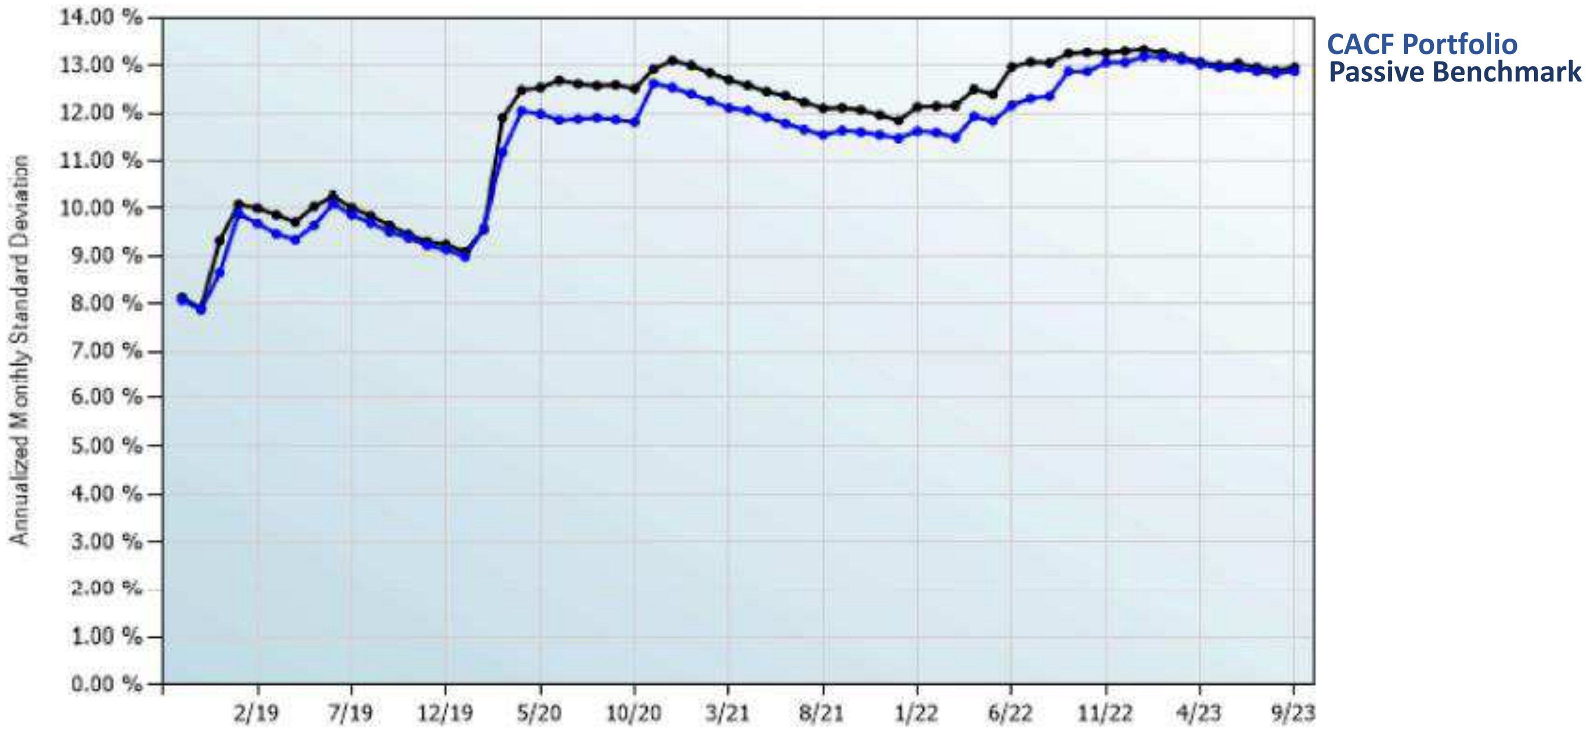
CACF Long-term Portfolio – Standard Deviation
September 30, 2023 (Final)

AGG30600Q CACF RELATIONSHIP

AGG30600Q CACF RELATIONSHIP (Consolidated - Annualized Standard Deviation) Data as of 9/30/2023



Standard Deviation - A measure of a Portfolio's return dispersion, standard deviation is a statistical measure of the range of a Portfolio's monthly performance. The higher the number the greater the dispersion of the returns. When a Portfolio has a high standard deviation, its range of performance has been very wide, indicating that there is a greater potential for large differences in returns from month to month. For example, if the average return is 10 and the standard deviation is 1 then more than half of the measurements are expected to fall within the range of 9% to 11%. It actually works out that over 99% of all points should fall within plus or minus three times the standard deviation. This means almost all measurements should fall between 7% and 13% in the example abo

Annualized Standard Deviation - Calculated by multiplying the Standard Deviation by the √12.
The Analytics risk factors are calculated using the last 72 months of data and displays the last 60 months. If 72 months are not available, the calculation uses all data up to that point. To create an Analytics graph requires 13 months of transactional data (1 to create the holdings records and 12 months of performance). These numbers are not linked to form any kind of cumulative trend line, all lines you see are created by connecting all of the risk factors over time.

In late 2019, Morningstar enhanced the current Morningstar Sustainability Rating Methodology by replacing Sustainalytics company ESG Rating with its ESG Risk Rating. This change resulted in different rating figures from those figures previously provided.

The Morningstar Historical Portfolio Sustainability Score is a weighted average of the trailing 12 months of Morningstar Portfolio Sustainability Scores. Historical portfolio scores are not equal-weighted; rather, more-recent portfolios are weighted more heavily than more-distant portfolios. Combining the trailing 12 months of portfolio scores adds consistency while still reflecting portfolio managers' current decisions by weighting the most recent portfolio scores more heavily. The score is rendered on a 0-100 scale where lower scores are better. In practical terms, most manager scores fall between 20-40.

Total Portfolio scores for both the CACF and Category columns represent the sum of the respective scores for each manager times the % of Total Allocation.
